

CLEARTREAT®

1000 SERIES

a product that protects the environment

CLEARTREAT® 1000 is a clay-based agglomeration material in powder form used for treating industrial wastewater. Its function is to add suspended solids to waste streams whose total dissolved and suspended solids are not adequate in quality or characteristic to afford proper flocculation. If you prefer a granular form to treat your industrial waste streams, then specify **CLEARTREAT® 1040** or **1200** when placing your order. **CLEARTREAT® 1000** (powder form) or **CLEARTREAT® 1040 & 1200** (granular form) provide a matrix to which flocculating agents and waste solids can attach allowing for proper separation. All three products are particularly effective in tying up heavy metals during flocculation.

APPLICATION

The rate at which to apply **CLEARTREAT® 1000** in waste streams containing low solids, is to mix 1 to 5 percent by weight prior to the addition of any flocculating agents. Dispersion is best achieved through moderate to high shear mixing. When subsequently adding flocculation mediums, agitation should be reduced to low to moderate shear. For specific analyses and recommendations of your individual waste stream, contact WYO-BEN, INC. or your local water treatment specialist for assistance. **CLEARTREAT® 1000, 1040** and **1200** are packaged in 50 lb. multi-wall paper bags, palletized and shrink-wrapped.
